

## LAB- Spring data rest

In this lab you will be understanding how to expose your Entities as Restful Resources

### STEP -1

In this step, you will be working on **05spring-data-rest-start** project

Run the Test.java 25 times so that dummy data will be populated with 25 clusters

1) To expose your entities as restful resources using spring data, you just have to annotate your Repository interface with `@RepositoryRestResource`.

All the configuration is already present in a class `RepositoryRestMvcConfiguration` configuration file.

All you need to do is import this configuration file in your configuration or make your configuration file extend this so that you can override the default methods for customization.

If you are using spring boot, all this configuration is autoconfigured.

2) Just deploy the application and give request to /. Follow all the links.

**Congratulations !! You know how to expose entities as rest resources using spring data rest**
