LAB- Spring Mvc - Rest paging

In this lab you will be understanding how to Paginate restful responses

STEP -1

In this step, you will be working on **02rest-paging-start** project

Run the Test.java 25 times so that dummy data will be populated with 25 clusters

1) Open ClusterController and implement TODO-1

Now deploy the application and give request to /clusters. You should see the paginated response. By default the page size is 20.

2) We want to customize the page size and default sorting behaviour. So, you have to override addArgumentResolvers in WebMvcConfigurer adapter

So, Open RestConfig.java and complete TODO-2

Congratulations !! You know how to do pagination of restful responses
